

JetBack™

Jet Lift Systems™

Rig Assisted Jet Pump Well Flowback

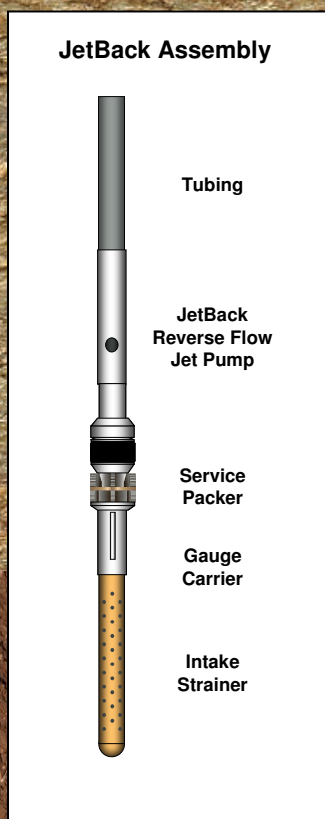

The JetBack system is a rig deployed jet pump and service packer, run in hole for post-frac clean up, for post-acid job flowback, or well testing. The service rig pump is used to power the JetBack jet pump, and lift rates typically range from 150 m³/D to 400+ m³/D, depending on the application.

Compared to difficult swabbing operations, the JetBack system easily handles sand and gas kicks, and can often reduce clean-up times by 70 to 80%.

The JetBack jet pump assembly is sized for optimal performance in the specific well, targeting maximum lift rate. Jet pumps are ideal for multi-phase flow and for sand handling.

Running a pressure memory gauge in the JetBack assembly allows operators to gain valuable reservoir information for permanent pump sizing.
