INTERESTING FACTS AND NEWS FROM THE WORLD OF WELLPACK

WELLPACK EXPANDS TO THE NETHERLANDS

COMPREHENSIVE LOGISTICS

Well Pack has entered the Dutch market.

The Czech company Well Pack has opened a new branch in the Netherlands, where it developed a service tool for its partner used in the logistics of flowers. As a provider of comprehensive logistics, Well Pack also offers solutions in the area of cleaning and servicing reusable packaging as well as value-added storage. It is also an advocate of the circular economy and sustainable logistics.

Well Pack offers value-added warehousing services, such as packaging and assembly.

The transportation and distribution of flowers represent an interesting area in which Well Pack operates. The hub of this business is located in the Netherlands, and its distribution network covers all of Europe. During distribution, flowers, for example, travel in transport racks, which are a significant component of circular, green logistics, as they are returnable. However, they can get damaged in transit and need to be repaired. For this purpose, Well Pack has manufactured and delivered to the Netherlands special service tables equipped with semi-automatic features for efficient and comfortable work in the repair center.

The tables were developed by our designers in the Czech Republic and subsequently manufactured on-site. Currently, it represents a modern repair center. We could replicate the same equipment elsewhere.

We have also designed these centers for repairs in other countries. For the service of racks, we designed two types of tables. On the S1 model tables, old damaged boards that are part of the carts used in retail chains for selling flowers are repaired. Production tables of the S2 model are used for manufacturing new boards.

The S1 model enhances work efficiency with its ergonomic design, which simplifies operations and optimizes time. Its advanced features allow for fast and precise work outcomes with minimal human effort. The S2 model adds to the acceleration of the manufacturing process, as it allows for performing multiple tasks concurrently, thus freeing operators' hands for other actions. With its efficiency and easy handling, this model significantly increases work productivity.

Both models together present new possibilities in the field of automation. They allow achieving desired results with the lowest possible input of human activity. They revolutionarily transform traditional manufacturing processes and set new standards for efficient work.

The challenging but rapid development of Well Pack led to the delivery of a total of 18 of these repair and production tables, including 12 models of S1 and six models of S2. The delivery also included five simple frames with a fixed plotter for fully manual repairs and production.

The development of these devices went through several phases, says Jaronír Opatrný. The first was crucial, during which current available technology was evaluated and solutions were sought for existing challenges.
